OBJECTIVE

Four-year Software Engineering student at Sai Gon University with a strong foundation in Java, JavaScript, and DevOps. Aiming to grow as a Full-stack Engineer with a long-term goal of building scalable, high-performance distributed systems. Passionate about system design, backend architecture, and performance optimization.

EDUCATION

Sai Gon University	Expected 2028
Bachelor of Software Engineering	Ho Chi Minh City, Vietnam
- GPA: 3.2/4.0 - Relevant Coursework: Advanced Web Development, Data Structures and Algorithms, Object-Oriented Programming (Java), Software Testing & QA, Database Management.	

SKILLS

Programming Languages (Proficient): Java, JavaScript, TypeScript

Frameworks (Proficient): Spring Boot, React, Node.js, Next.js

Databases (Proficient): MongoDB, PostgreSQL, Redis

Cloud (Familiar): AWS, Cloudflare, Supabase

Tools: Docker, Git, Postman, GitHub CI/CD, Kafka

Languages: Vietnamese (Native), English (Advanced)

PROJECTS

Animeflix – Anime Streaming Platform [GitHub]	Jun 2025 – Present
<i>Next.js 15 (App Router), React 19, TypeScript, MongoDB, Redis, NextAuth, Vidstack, Vercel</i>	

- Optimized Next.js 15 App Router with Server/Client Component separation, achieving Lighthouse SEO 100/100, Accessibility 92, and Best Practices 96.
- Engineered Redis caching across Anify, Consumet, and Zoro providers, reducing response time by 75–85% and eliminating 99% of rate-limit errors on high-traffic routes.
- Implemented HLS adaptive streaming via Vidstack with MongoDB-backed watch history, retaining user progress across 100% of sessions.
- Deployed on Vercel with automatic scaling, handling multi-provider fallback. 🏆 **ANIMEFLIX**

Animeflix Third-Party System [GitHub]	Oct 2025 – Present
<i>Spring Boot, Docker, MongoDB, Kafka, Redis (Upstash), RAG, AWS</i>	

- Designed the microservices backend as a developer-facing API platform, allowing third-party developers to integrate via API key authentication with configurable rate limits (1,000 req/hour default).
- Engineered JWT Auth service using JJWT with access/refresh token rotation (15-min/7-day TTL) and Redis-backed rate limiting at 1,000 req/hour per API key.
- Implemented Kafka event pipeline (Catalog → User service) with manual commit and partition key by animeId, delivering real-time episode notifications via WebSocket to online users.
- Building Hybrid Search module combining keyword search (Redis-cached, 20–30 ms) with semantic search via vector embeddings across 18,000+ anime titles.
- Containerized all 4 services with Docker; architected for AWS deployment with independent scaling per service.

ACTIVITIES & INTERESTS

- Passionate about building scalable, modern systems and user-centric web architecture.
- Active football player; continuously improving English communication for professional growth.
